

Where does the old “genre effect” live? (231-ckpt × 16-cell factorial re-eval)

Method: balanced 2^4 ANOVA on within-checkpoint-centered $R = S(\text{ckpt}, \text{cell}) - S(\text{base}, \text{cell})$; $\eta^2 = SS/SS_{\text{total}}$; remainder (3/4-way + ckpt×cell) = 46.1%. Data: prescription/p0c/p0c_scores.json, n = 230 trained ckpts + base.
